REMOULDABLE ●

- Wheel Chairs • Therapy • Bathing • Seating •
- Transport • Feeding • Sleeping • General Use •

One of the foremost posture care ranges in the market today, BURNETT REMOULD products are remouldable supports which have been widely regarded for over 50 years.

Available in vacuum-moulded or self-regulating supports, BURNETT REMOULD products can be utilised across multiple environments and provide posture support and relief for over 30 medical conditions.

REMOULD *postural support as unique as you are*

Designed for people who require postural support assistance, BURNETT REMOULD products are easily shaped to an individual users own anatomical body contours, helping provide unique stability and comfort across a wide range of settings.

With the ability to remould shapes and vary the thickness of the support, BURNETT REMOULD products provide an ongoing relief and support system as user needs change over time and, in the case of infants and paediatrics, keep up with with natural growth spurts.

INGENIOUS SIMPLICITY - HOW IT WORKS

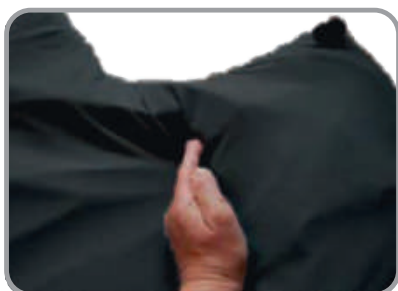

BURNETT REMOULD products comprise of a durable and watertight outer vinyl pouch that houses thousands of soft beads*. Much like a beanbag, the concept involves the precise manipulation of the beads around exacting body contours, giving a moulded support as unique as the individual user.

Products are categorised as either vacuum-moulded or self-regulating:

VACUUM-MOULDED

All vacuum-mould products work by using a pump to extract air from the product pouch. This causes the pouch to become semi-firm, allowing the thousands of internal beads to be manipulated into a bespoke shape for the user. Once the desired shape is moulded, further air extraction compacts the moulding and sets the shape.

It is only with the reintroduction of air via the product valve that the product pouch will return to a malleable state ready for remoulding.

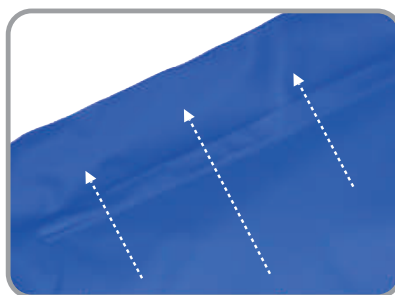

Air is vacuumed out allowing bead positioning to be manipulated by hand and set into a bespoke moulded support.

SELF-REGULATING

For self-regulating products, no pump is required. Instead as weight is applied to the product, air is naturally expelled into a hollow chamber flap at the extremity of the product pouch, allowing the beads to mould into a supportive shape according to the weight distribution. As the product warms up e.g. through body heat transfer or bath water, so the pouch becomes more pliable.

When weight is alleviated, the air returns to the pouch dispersing the bead moulding and the pouch is ready for re-use.

When weight is applied to the pouch, air is dispersed allowing the now compacted beads to mould into the corresponding supportive shape

*BS1353 Bath Pads products contain an impressionable foam.

The BURNETT REMOULD Bathing Family comprises postural support products specifically designed for assisted bathroom use.
